The latest update to the popular open source product, OpenSSL 1.0.2k, provides an additional mechanism to block host impersonation attacks. At a high level, while the original bug fixes in version 1.0.2k already provide a fix for the "man-in-the-middle" attack scenario, OpenSSL 1.0.2k also introduces a new "hostname mismatch" mechanism. This means that the new version of OpenSSL includes not just one but two checks to verify the authenticity of a certificate. On top of the new checks, OpenSSL 1.0.2k removes support for deprecated TLS protocols like SSL v3, as well as allows for new TLS protocols like "sni-tls" and "http/2".
