Many methods can be used to draw in AutoCAD, such as Freehand drawing, or creating objects in other applications like Microsoft Office and Photoshop and importing them into AutoCAD. Unlike older programs that limited you to drawing with the mouse and keyboard, AutoCAD 2018 is completely compatible with CAD and GIS applications. AutoCAD features The following are some of the features of AutoCAD 2018: The most important feature is the support of all the latest industry-standard CAD formats and drawing standards. AutoCAD 2018 provides a powerful drafting environment that is fully compatible with other CAD and GIS applications, making it easy to use across multiple platforms. AutoCAD 2018 runs on Windows, macOS, Linux, Android, iOS, and other platforms, including Microsoft Windows, macOS, and Linux. AutoCAD is a robust drawing application that is suited for a wide range of drafting needs from a desktop, tablet, or phone. AutoCAD supports a wide range of industry-standard CAD formats, such as STEP, IGES, DWG, and even several CNC formats, while also supporting a large number of file extensions. With the new 2018 Release, it is now even easier to work with CAD files on mobile devices with the ability to edit in both AutoCAD and another application at the same time and for real-time collaboration with others using mobile device versions of the AutoCAD platform. For details on the AutoCAD API refer to the Autodesk API guide. The Autodesk Exchange API also allows connecting to Autodesk Exchange documents and responding to commands, including uploading and downloading files. GitLab as code repository Git is a revision control system, the premise of which is that the entire history of every version of a file can be retrieved and stored for easy review and future access. Git works in binary repositories, so it is not appropriate for human-generated files such as Microsoft Word documents. However, GitHub is an example of where this model has been applied successfully to human-generated files. For information on using Git with AutoCAD, refer to: .NET Framework API for.NET Plugins NET Framework is a programming language and associated development tools in.NET. It allows you to use the.NET Framework class libraries to write applications that are more extensible and easier to manage than traditional code. NET Framework is part of the.NET Framework, which is available from Microsoft. Programs written in the.NET Framework are known as.NET Framework applications. Examples of.NET Framework applications include Microsoft Office, Microsoft SQL Server, and Microsoft Windows..NET Framework applications can also be used as plugins to support AutoCAD's.NET Framework-based APIs. For information on the.NET Framework and how it is used to support AutoCAD's NET-based APIs, refer to: Visual LISP Visual LISP is a general-purpose, object-oriented functional programming language. It supports syntax that resembles Smalltalk, and it is intended for the development of user interfaces. It is available for Windows, Linux and Mac OS X. Visual LISP is a native language and therefore does not require special translation of AutoCAD files. Visual LISP's syntax is identical to that of AutoCAD's native commands. Visual LISP was previously used by: It can be integrated with AutoCAD by using the AutoLISP application programming interface (API) to access the C++.NET API for AutoCAD: Microsoft Visual Studio contains a free developer environment called Visual LISP. Visual LISP allows you to write applications in Visual LISP for use with AutoCAD. Visual LISP is a native language and does not require translation of AutoCAD files. When this user is created by the web application, we want to add a User Profile property and two custom User Profile fields that are associated with the user (as well as the existing fields in the list/library the user is being created in). It's all working, but I've run into a bug in the code that we've discovered. Using the SPFieldUserProfileValue object, the "User Creation Time" property of the created user object is not being persisted to the database when the user object is saved. We've traced it through and it seems to be getting set properly during the user's properties collection, but when the site/list/library is saved, the User Creation Time property is null. Code in the following method saves
