FIG. 1 is an exploded, perspective, side view of a conventional capacitor assembly 2. The capacitor assembly 2 consists of a case or housing 4 and a plurality of capacitor units 6. Each capacitor unit 6 has a bottom plate 8, a center body 10, and two upper plates 12, which are attached to the center body 10 and extend beyond the center body 10. The center body 10 further comprises two opposite side flanges 14, which interconnect the opposite sides of the center body 10. The side flanges 14 extend beyond the center body 10. Each upper plate 12 further comprises two opposite end legs 16, which are attached to the center body 10 and extend beyond the center body 10. The side flanges 14 and the end legs 16 together form a U-shape. The side flanges 14 are attached to the center body 10 by soldering the side flanges 14 to the center body 10, and the end legs 16 are attached to the center body 10 by soldering the end legs 16 to the center body 10. The side flanges 14 and the end legs 16 interlock with each other to form a stable design. Referring to FIG. 1 again, a female header 18 is mounted on the case 4, and an IC package 20 is mounted on the female header 18. Each capacitor unit 6 is attached to a corresponding position of the IC package 20. Each capacitor unit 6 is electrically connected to the corresponding IC package 20 through soldering. Through this method of assembly, the capacitor assembly 2 is mounted to the IC package 20. However, the center body 10 is separated from the case 4 during the assembling process. So, the capacitor assembly 2 is unstable when the IC package 20 is mounted to the female header 18. If it is necessary to
