AV Tester is an easy-to-use tool for testing your Anti-Virus solution. It was developed using the Mono framework for Windows. UnityPro AV Tester Activation Code will try to execute files that contain a special EICAR test pattern. If your Anti-Virus solution is watching, it will almost immediately go off, proving it is functioning properly. You should install UnityPro AV Tester in each computer that has Anti-Virus installed or use it in a test environment where only Anti-Virus was installed. If the Anti-Virus solution is installed in the computer, it will be running when you run AV Tester; it will go off if it is not running. You can test your Anti-Virus solution without having to add a file to the system. For example, if your Anti-Virus solution was installed in C:\Program Files, you would have to add a file to the system for testing purposes. UnityPro AV Tester will test the Anti-Virus solution on the computer itself, without having to add a file to the system. This means that your test is going to look much more like the actual scenario instead of trying to use something that is not going to exist in your system. In other words, AV Tester will not be able to directly add files to your system, so it will not be able to write any files that were added by the Anti-Virus solution; it will just look for them and test the anti-virus solution.
