Even though it's available in all Windows operating systems, Net Activity is a Windows 7 specific gadget. It doesn't require installation or setup, which is a great feature for this type of gadget. Its looks are designed for easier access and interaction, and it incorporates basic options for controlling CPU usage, disk usage and processor. Among the other features available on Windows 7, is the ability to send status updates via e-mail for additional convenience. Being able to see how much usage is going on and with which program can be essential for monitoring background tasks. As with many gadgets, Internet Connection Status Monitor is prone to occasional crash. Depending on the circumstances, it may come back from the dead. But you will get an indication about what happened. Since it's a basic gadget, Net Activity allows only the most basic of configurations. The following settings can be adjusted: Size of the monitor – from small to large, full screen, and tile Allow showing stats – including a brief history, and a total view Display status, such as CPU usage, disk usage, etc. Color Show TCP/UDP display Switch to a custom icon Link to Internet Explorer – or not Optionally, it can be configured to automatically send status reports via e-mail to a specified e-mail address. The interface is very straight forward, with a checkbox for each setting. The options menu is quite simple, showing only the primary settings that Net Activity allows. It's not as elegant as its name suggests. It's not really a monitor. It

does not include any displays, so the name is misleading. Internet Connection Status Monitor is more of a tool to monitor Internet activity. It's just that part of the process that can be done with a physical monitor, although there is a lot of overhead in doing so. The volume has been given a new icon and several little improvements have been made to make it more modern.
